Continuation of 11. does NOT place the application in condition for allowance because: Applicant's arguments largely repeat that which was argued previously in a reply filed on April 11th, 2006 detailing that Hirabayashi does not disclose a 50-70 degree angle for contact. It is the very essence of the reference that a trapezoidal form (thus having and angular edge between the outer and inner ends) allows for better contact. As clearly shown in the figures 1a and 1b, the angle shown falls within this range. Thus applicant is merely claiming the optimized range for what has already been invented. Applicant's new argument is unfounded. Nowhere in the paper of Hirabayashi is language of "maximize the contact area" given. All Hirabayashi was aiming for was contact along the entire side (this is supported by the solution he provides by accounting for the "mismatch of the spacers to the widened space between the bilateral spinous processes") in order to maintain a fixed positioning of the spacer by providing a double trapezoidal design. Having a hole, or not having a hole makes no difference because contact is still maintained along the spacer defining the hole. Further, Ford provides for roughened ends to increase friction and thus stability. So overall, an increased contact along the entire spacer results both from roughed ends as well as angled ends.
